JUSTANOTHERPM

AI PM Accelerator

Six weeks, live. You build three real AI products and put them on the internet — including one that is entirely your own idea. You leave with links you can send to anyone, not a certificate.

Cohort 4 · Starts 22 November 2026

60 seats · Live with Sid Arora, Head of Product for Gen AI at Yelp

6	3	60	4–6
weeks, live	products you ship	seats, one cohort	hours a week

THE PROGRAMME

You don't learn about AI. You build with it, from week one.

Most AI courses teach you concepts. This one makes you build. You start your first product in the very first session, and ship your own idea by Demo Day.

You don't write the code. You direct Claude Code, the same way AI products get built in the real world. No engineering background needed.

Format	Live, cohort-based. Not self-paced.
Duration	6 weeks · 6 live sessions of about 2 hours each, including Demo Day
Starts	**22 November 2026**
Cohort size	60 students, capped
Instructor	Sid Arora — Head of Product for Gen AI at Yelp, creator of JustAnotherPM
Time needed	4–6 hours a week, including the live session
Prerequisites	Working understanding of product management. No coding required.
Time zones	Two sessions a week — one for North America, one for Europe and India. Attend either.

The three products you build

WEEKS 1–2

Your Second Brain

A personal AI knowledge tool that answers from your own notes and documents. You build it in week one and then study the rest of the course from the product you built.

WEEKS 3–4

A multi-agent app

A real application built end to end with the cohort. Agents that reason, use tools and keep working while you sleep.

WEEKS 5–6

Your own idea

You scope it, test it, ship it to a live URL, and demo it to the whole cohort on Demo Day.

What you walk away with

- **Three AI products you built yourself, live on the internet.** Links you can send to anyone. Not a certificate.
- **An AI second brain that keeps working after the course ends.** The tool you studied with is the tool you keep.
- **Proof for the rooms that matter.** In an interview or a promotion conversation, you show working products and how you tested them.

WEEK BY WEEK

Six weeks. Every week you build something real.

Every week has the same rhythm: short pre-reads, one live session with Sid, and something real you build before the next one.

01 WEEK

The AI PM Role

How AI products behave differently from normal software, and what that changes about your job. The questions to ask at every stage. The four common ways AI projects fail. How to prioritise an AI roadmap.

You build: **Second Brain v0**, running on your machine.

02 WEEK

How AI actually works

How an LLM produces an answer, and why it sometimes makes one up. How RAG lets AI answer from your own data. Prompts that get reliable results. What embeddings do, and what an agent can and cannot do.

You build: **RAG into your Second Brain** — you learn it by building it.

03 WEEK

Product sense, design and evals

How to take apart any AI product. The AI-First PRD. How to define what "good" means, build a golden set, and use one model to grade another. Guest session on running evals in production.

You build: **a real eval suite** for your own product.

04 WEEK

Build with Claude Code

The build loop that stops AI projects spiralling. The agent architecture decision tree: one call, a pipeline, sub-agents or multi-agent. MCP and connectors. Keeping running costs sensible.

You build: **a multi-agent application**, live, together.

05 WEEK

Testing and launch

The testing loop: test, judge, diagnose, fix, retest. Must-pass, edge and fail-safe cases. The four launch audits — security, code quality, prompt injection, cost and latency. Deploying to a live URL.

You build: **your own product**, tested and live.

06 WEEK

Demo Day

You present your live product to the cohort and get structured feedback from peers and from Sid. Plus positioning your AI product, writing a launch post, and adding payments if you want to charge for it.

You leave with: **a demo video and a portfolio one-pager**.

PROOF

What people with no engineering background shipped.

Every product below was designed, built and shipped by a product manager during a previous cohort. None of them had an engineering background. None of them wrote code by hand. Each one is live at a real URL.

AxleWise	Stop guessing with car repair bills. Run an estimate through it and see which repairs actually matter and whether the price is fair.
Eatbit	Snap a photo of your food or describe it in a sentence. Instant nutrition breakdown. No logging, no guessing.
LearnDeep	Every school subject explained until you actually get it — built by a parent for their own child's exams.
Invoice Read	Flags what needs fixing in an invoice, and keeps a record of exactly what was checked and what you decided.
Transform Home	Upload one photo of a room and get realistic renovation concepts with a budget-ready shopping list.
The Brand Alchemist	Type what a post is about and get three on-brand cards in 15 seconds. Right colours, right voice.
Proactive Client Engagement	Turns hours of portfolio checking into one screen that ranks which clients need a call today, with the context already written.

IN THEIR OWN WORDS

Verbatim, from people who finished.

Quotes below are unedited, shared on Demo Day and in post-course feedback.

> *"Before this course I had a high level understanding of AI and the importance of context, but I hadn't built something myself. Throughout the course I learned a core framework on when to use AI in a product, and how to then build that idea. I was able to create a health advocacy application, get beta testers and even start to show it to doctors. I feel confident as a Product Builder and a Product Leader now."*
>
> **Lauren · Product Manager**

> *"Before this cohort, I felt like I was watching AI product management from the outside. I had years of PM experience and strong domain instincts, but every time someone talked about prompts, evals, or AI failure modes, I'd nod along while quietly wondering whether I'd ever actually be able to do this myself. What surprised me most wasn't how technical it was, it was how much good PM thinking directly transfers once you know where to apply it. I came in wanting AI knowledge as a career differentiator. I'm leaving with something more useful."*
>
> **Maitreyi · Product Manager**

> *"As a PM I have been working on some cutting-edge products, but there were gaps in my concepts and experience when it came to AI products. Sid's course takes you from a starter level to a stage where you feel confident about building product prototypes. I would recommend this course to anyone in my shoes."*
>
> **Ram · Product Manager**

> *"This course is among the most well-structured and carefully curated AI PM programs I found. I compared six or seven alternatives before choosing it. I would strongly recommend it for anyone wanting to learn AI from the basics through to real-world implementation."*
>
> **Vivek · Product Manager**

> *"Prior to this course I had no formal training on shipping AI products. This course helped me build a mental model and a framework that helps me ship products to production — using evals, and best practices on when and when not to use AI. The live sessions were game changers for me."*
>
> **David · AI Product Manager**

YOUR INSTRUCTOR

Sid Arora

Head of Product for Gen AI at Yelp. Building AI products is his day job — the decisions this course teaches are the decisions he makes every week.

He also builds in public. He has built a working AI email assistant live on stage in 90 minutes, and a nine-agent content engine in front of 150+ people watching live, the same way you will build in this course.

Nearly 3,000 people have taken his free Claude Code course, and his AI breakdowns in JustAnotherPM reach a combined audience of over 100,000 PMs and builders. Close to a hundred PMs have been through his paid cohorts.

He runs every live session himself and personally reviews every student's product. No TAs. No outsourced feedback.

Questions people ask

Do I need to code?

No. You direct Claude Code, which writes it. Being comfortable reading code helps, but past students who had never written a line shipped working products.

Do I need an idea first?

Helpful, not required. You pressure-test ideas in week two and write the full spec in week three, by which point you have already built two products.

Who is this not for?

People wanting a pure ML engineering course, anyone brand new to product management, and anyone who can't commit 4–6 hours a week.

Are sessions recorded?

Yes, shared within 24 hours, and yours for life. Live is still where the real value is.

Can my employer pay?

Around 90% of Cohort 1 students were reimbursed through their company's learning budget. We provide the documentation to support the request.

What if I miss a week?

Watch the recording and ask in the cohort Slack. Sid answers there between sessions.

Cohort 4 starts 22 November 2026

60 seats, and they go in the order people join. List price $1,500. Enrolment is open now.
